```
Calculate the number of orders and percentage of total orders
represented by each order status.

A - 10 - 10/70
B - 20 - 20/70
C - 40 - 40/70

select
  Status,
  count(*) as no_of_orders,
  round(count(*)*100.0/(select count(*) from `e1.orders`),2) as
percentage_of_orders
from `e1.orders`
group by Status
order by no_of_orders desc

select count(*) from `e1.orders`

Using order_items, find the top 5 products based on total
quantity sold.

Display:

ProductID
Total quantity sold
```

```
Number of order-item records
Total sales value

select
  ProductID,
  sum(Quantity) as total_quantity_sold,
  count(*) as NoOfOrderItems,
  sum(Total) as total_sale_Value
from `e1.order_items`
group by ProductID
order by total_quantity_sold desc
limit 5

Consider only order-item records where the total value of that
item is greater than ₹2500.

For each product, calculate:

Number of such records
Total quantity
Total sales value

Display products having at least 3 qualifying records.
```

```
select
ProductID,
count(*) as NoOfOrderItems,
sum(Quantity) as total_quantity_sold,
sum(Total) as total_sale_Value
from `e1.order_items`
where total > 2500
group by ProductID
having NoOfOrderItems >= 3

For each product, calculate:

Minimum selling price
Maximum selling price
Average selling price
Number of order-item records

Display only products where the minimum selling price is greater
than ₹10,000.

Sort by average selling price descending.

select
  ProductID,
```

```
  max(SellingPrice) as max_sp,
  min(SellingPrice) as min_sp,
  avg(SellingPrice) as avg_sp,
  count(*) as no_of_order_item
from `e1.order_items`
group by ProductID
having min_sp > 1000
order by avg_sp desc

For every warehouse, calculate:

Number of different products stored
Total stock
Average stock per product

Display only warehouses storing at least 5 different products.

Sort by total stock descending.

select
  WarehouseID,
  count(distinct ProductID) as no_of_products,
  sum(Stock) as total_stock,
  round(avg(Stock),2) as avg_stock
from `e1.inventory`
group by WarehouseID
having  no_of_products >= 5
```

```
order by total_stock desc

select *
from `e1.inventory`
order by ProductID

Find products whose MRP is greater than the average MRP of all
products.

select avg(MRP)
from `e1.products`

select *
from `e1.products`
where MRP >= 2312.74

select *
from `e1.products`
where MRP >= (
                select avg(MRP)
                from `e1.products`
              )
```

Find products whose MRP is below the average MRP.

```
select *
from `e1.products`
where MRP < (select avg(MRP) from `e1.products`)
```

Find the product or products having the highest MRP.

```
select max(MRP)
from `e1.products`
```

```
select *
from `e1.products`
where MRP = 4937
```

```sql
select *
from `e1.products`
where MRP = (select max(MRP)
             from `e1.products`)

find those products which have the top 5 mrp prices

select distinct(MRP)
from `e1.products`
order by MRP desc
limit 5

select *
from `e1.products`
where mrp >= 4662
```
