```
find all the products whose mrp is greater than the average mrp

select round(avg(MRP),2)
from `e1.products`

select *
from `e1.products`
where MRP > 2312.74

select *
from `e1.products`
where MRP > (select round(avg(MRP),2)
from `e1.products`)

filter out those products whose mrp is among the top 5 distinct
highest mrps

select min(select distinct(MRP)
from `e1.products`
order by MRP desc
limit 5)
from `e1.products`
```

```sql
select distinct(MRP)
from `e1.products`
order by MRP desc
limit 5

select *
from `e1.products`
where (MRP = 4937) or (MRP = 4927) or (MRP = 4880) or (MRP =
4698) or (MRP = 4662)

select *
from `e1.products`
where MRP in (4937 , 4927 , 4880, 4698, 4662)

-- super crazyy mentos zindagi
select *
from `e1.products`
where MRP in (
             select distinct(MRP)
             from `e1.products`
             order by MRP desc
             limit 5
             )
```

```
Find the product or products having the highest MRP.

select max(MRP)
from `e1.products`

select *
from `e1.products`
where MRP = 4937

select *
from `e1.products`
where MRP = (select max(mrp) from `e1.products`)

select *
from `e1.products`
where MRP in (select max(mrp) from `e1.products`)

Find products supplied by suppliers who supply at least 5
products.

select
  SupplierID,
  count(*) as no_of_products
from `e1.products`
group by SupplierID
```

```
having no_of_products >= 5

select *
from `e1.products`
where SupplierID in (
                      select
                      SupplierID
                    from `e1.products`
                    group by SupplierID
                    having count(*) >= 5
                      )

Find customer IDs who have placed atleast 3 orders.

select *
from `e1.orders`
limit 5

select
  CustomerID,
  count(*) as no_of_orders
from `e1.orders`
group by CustomerID
having no_of_orders >= 3
order by no_of_orders desc
```

```
Display details of those customers who have placed atleast 3
orders

select
  CustomerID
from `e1.orders`
group by CustomerID
having count(*) >= 3

select *
from `e1.customers`

select *
from `e1.customers`
where CustomerID in (
                  select
                    CustomerID
                  from `e1.orders`
                  group by CustomerID
                  having count(*) >= 3
)

Find suppliers whose number of products is
greater than the average number of products supplied per
supplier.
```

```
s1 --> c1
s2 --> c2
s3 --> c3

avg -> c1+c2+c3/3

select
  SupplierID,
  count(*) as no_of_products
from `e1.products`
group by SupplierID

select
  avg(no_of_products)
from (select
      SupplierID,
      count(*) as no_of_products
    from `e1.products`
    group by SupplierID
    )

select
  SupplierID,
  count(*) as no_of_prds
```

```
from `e1.products`
group by SupplierID
having no_of_prds >= (
                    select
                      avg(no_of_products)
                    from (select
                            SupplierID,
                            count(*) as no_of_products
                          from `e1.products`
                          group by SupplierID
                          )
                    )
```
